Figure 2. Test Panel for Diagnosis and Classification of Common von Willebrand Disease Types

**von Willebrand Comprehensive Panel**
Test Code 19790X

Includes
- aPTT
- VWF Antigen
- Ristocetin Cofactor Activity
- Factor VIII Activity, Clotting
- Multimeric Analysis
- Interpretation

Benefits
- Includes key tests for VWD diagnosis and typing
- Provides interpretation of test results and additional comments

Further testing is required to identify VWD type 2N and to help differentiate between VWD types in some cases. Adding the VWF collagen binding assay to this panel may increase sensitivity for VWD detection. The additional comments provided on the report help with interpretation of results in the context of ABO blood group, the acute phase, oral contraceptive use, menstrual cycle phase, and specimen collection and storage methods. aPTT indicates activated partial thromboplastin time assay; VWF, von Willebrand factor; and VWD, von Willebrand disease.
