

## Continuity of care from Pap testing to biopsy results

As recommended by the College of American Pathologists, cytologic-histologic correlation can best be achieved when the same lab receives and performs both the Pap test and the biopsy for a given patient.<sup>1</sup> At Quest Diagnostics, **we perform both Pap tests and biopsies**, with correlation of results to ensure continuity of care for your patients.

### The quality of the Pap matters

At Quest Diagnostics, **our Pap process is designed to exceed expectations.**<sup>2</sup> We are committed to maintaining high laboratory standards that help you diagnose with confidence.

**Almost 1 out of 5 Paps** are reviewed by a second highly trained professional.

**We evaluate more Paps and high-grade lesions than most labs**, so you can trust our experience to support your diagnosis of both routine and high-risk cases.

**Our quality control standards** meet and often exceed all state and federal requirements.

### Feel confident in results backed by highly trained professionals

Our team of medical experts includes 450 anatomic and clinical pathologists, including many with a gynecologic subspecialty. They meet frequently to discuss your most challenging cases.

**This valuable, collaborative process helps us provide results you can trust.**

# Quest Diagnostics Gynecologic Pathology Services

## Biopsy testing you can trust

### Appropriate and prompt patient management

Because we review both Pap and biopsy results, our pathologists can:

- Perform cytologic-histologic correlations that help confirm/resolve cytologic impression
- Discuss and resolve discrepancies between the two specimens
- Document cytologic-histologic correlations in the surgical report

### A full range of staining capabilities

Quest Diagnostics offers special and immunohistochemical (IHC) stains on biopsy specimens for better visualization and interpretations.

In an ideal, high-quality performance environment, laboratories would receive both cytologic and histologic specimens from the same patient and be able to correlate these results to improve patient outcomes.<sup>1</sup>
